

Items Service

Build a small REST API in Node.js using the Express framework.

Requirements:

1. GET /items returning the list of items as JSON.
2. GET /health returning HTTP 200 so the service can be monitored.
3. Unit tests covering both endpoints.
4. Data may be kept in an in-process store. No external database is required and no authentication is required.

Deliverables: the Express application, its package.json, and the test files.
