

Task Manager REST API (Python)

Build a REST API in Python using the Flask framework.

Requirements:

1. JWT authentication protecting every /tasks endpoint. Requests without a valid Bearer token must be rejected with HTTP 401.
2. PostgreSQL persistence for tasks (id, title, done).
3. CRUD endpoints: GET /tasks, POST /tasks, PUT /tasks/<id>, DELETE /tasks/<id>.
4. A GET /health endpoint returning the service status.

Deliverables: the Flask application and its dependency list.
